

Employee Performance Mapping System

1. Project Title

Employee Performance Mapping and Salary Analysis System

2. Objective

The objective of this project is to design and analyze an employee performance Mapping system using SQL. The project focuses on:

- Tracking employee performance
- Mapping employees to projects
- Identifying specialized teams (Data Science Team)
- Analyzing salary and performance metrics

3. Tools & Technologies Used

- MySQL Database
- SQL (Structured Query Language)

4. Database Description

This project is based on three main tables:

1. Employee Record Table

Stores general employee information:

- Employee ID
- First Name
- Last Name
- Salary
- Rating (Performance Score)
- Country
- Continent

2. Project Table (Project Table)

Stores project-related data:

- Project ID
- Project Name
- Domain
- Start date
- Closure Date
- Dev Otr
- Project Status

3. Data Science Team Table

Stores details of employees working in the Data Science team:

- Employee ID
- First name
- Last name
- Department
- Role
- Experience Level
- Country
- Continent

5. Problem Statement

The goal of this project is to:

- Map employees to their respective projects
- Evaluate employee performance using ratings
- Calculate performance-based bonuses
- Analyze salary distribution across regions
- Identify employees working in the data science team

6.Results & Observations

- Indexing significantly improved query performance
- Bonus calculation reflects employee performance effectively
- Salary analysis shows variation across continents and countries
- Project mapping helps track employee contributions
- Data science team analysis highlights specialized workforce

7. Conclusion

This project successfully demonstrates:

- Efficient employee data management using SQL
- Performance-based analysis and mapping
- Use of joins and aggregation for meaningful insights
- Query optimization techniques for better performance
